

Portfolio Section — Detection Engineering Evidence

Portfolio Section — Detection Engineering Evidence

****Date:**** 2025-11-11

****Owner:**** Gabriel Marquez

This section consolidates the dual-purpose artifacts (interview + Capstone) for two validated detections in Elastic.

Detection 1 — Suspicious PowerShell Flags (EQL)

- ****MITRE:**** T1059.001 (PowerShell) — Execution
- ****Rule type:**** EQL (process) — Schedule 5m, look-back 1m
- ****Risk score:**** 75 (High)
- ****Query (EQL):**** See playbook
- ****Evidence:**** 12–18 (rule run, telemetry verified, alerts and details)
- ****Interview angle:**** Obfuscated execution detection; command-line analysis; endpoint telemetry validation; `kibana.alert.rule.name` filtering gotchas.

Detection 2 — Failed Logon Burst (4625)

- ****MITRE:**** T1110 (Brute Force) — Credential Access
- ****Rule type:**** Threshold on KQL (per host or user) — Schedule 5m, look-back 1m
- ****Risk score:**** 75 (High)
- ****Query (base KQL):**** `data\_stream.dataset: "system.security" and winlog.event\_id: 4625`
- ****Evidence:**** 19–21 (ingestion verified); 22–23 if/when threshold rule is enabled and fires.
- ****Interview angle:**** Windows Security ingestion via System integration; threshold tuning; false-positive management.

Capstone Mapping (WGU D490)

- ****Task 2B (Framework Alignment):**** MITRE T1059.001 and T1110 cited; ATT&CK alignment narrative
- ****Task 2F (Validation):**** Rule preview runs, manual execution tests, telemetry checks
- ****Task 2H (Portfolio Presentation):**** Playbooks and screenshots assembled for reviewers
- ****Task 3 (Evidence/Artifacts):**** Rule definitions, screenshots, and test commands

Notes

- All alert filtering performed with `kibana.alert.rule.name` (Elastic 8/9.x field convention).
- Index scope includes `logs-\*` and `endpoint.events.\*` to cover both System and Elastic Defend sources.
